 - Voronoi Diagrams
 - Generalized Voronoi Diagrams (GVDs)

Generalized Voronoi Diagram (GVD)

- The *Generalized Voronoi Diagram (GVD)* is a set of points where the distance to the two closest obstacles is the same.
- *Voronoi Diagram* is defined for a set of points called *sites*
- Let P be a set of n distinct points (*sites*) in the plane
- *Voronoi Region* is the set of points closer to a particular site
- *Voronoi Diagram* is the set of points equidistant from two sites
- This will be the subdivision of the plane into n cells, one for each *site*
- In the planar case *Voronoi Diagram* is a collection of line segments

p_i : site points v : Voronoi vertex
 q : free point e : Voronoi edge

Defining futures

Roadmaps

- Roadmaps
 - Voronoi Diagrams
 - Generalized Voronoi Diagrams (GVDs)

Generalized Voronoi Diagram (GVD)

- For the purpose of path planning we think of **sites** as *obstacles*
- Therefore the generalized *Voronoi Region* F_i is the set of points closest to QO_i

$$F_i = \{q \in Q_{free} \mid d_i(q) \leq d_h(q) \quad \forall h \neq i\}$$

where $d_i(q)$ is the distance to an obstacle QO_i from q

$$d_i(q) = \min_{c \in QO_i} d(q, c)$$

p_i : site points v : Voronoi vertex
 q : free point e : Voronoi edge

Defining futures

Roadmaps

- Roadmaps
 - Voronoi Diagrams
 - Generalized Voronoi Diagrams (GVDs)

Generalized Voronoi Diagram (GVD)

- The basic building block for the **GVD** is the set of points equidistant from two obstacles QO_i and QO_j known as a *two-equidistant surface*

$$S_{ij} = \{x \in Q \mid (d_i(x) - d_j(x)) = 0\}$$

- This surface pierces obstacles so we restrict it to a *two-equidistant face*

$$F_{ij} = \{q \in S_{ij} \mid d_i(q) \leq d_h(q) \quad \forall h\}$$

- Thus the union of *two-equidistant faces* makes the GVD

$$GVD = \bigcup_i \bigcup_j F_{ij}$$

p_i : site points v : Voronoi vertex
 q : free point e : Voronoi edge

Roadmaps

- Roadmaps
 - Voronoi Diagrams
 - Generalized Voronoi Diagrams (GVDs)

Generalized Voronoi Diagram (GVD)

- A point q lies on a *Voronoi Edge* between sites p_i and p_j iff the largest empty circle centered at q touches only p_i and p_j
- A *Voronoi Edge* is a sub-set of locus of points equidistant from p_i and p_j .

Defining futures

Roadmaps

- Roadmaps
 - Voronoi Diagrams
 - Generalized Voronoi Diagrams (GVDs)

Generalized Voronoi Diagram (GVD)

- Extending to polygonal objects:
 - Features of an obstacle are vertices and edges
 - A roadmap edge must be between some pair of features.

edge - edge

vertex - vertex

vertex - edge

 - GVD Implementation
 - Bug Algorithm

GVD Implementation Bug algorithm

- Online Diagram Generation:
 - Locate two nearest obstacles and move to midpoint
 - Continue along GVG edge until “meet” point
- Detect new GVG edges
- Select one to explore and continue
 - Detect boundary points and cycles

 - Brush Fire Algorithm
 - Sweep Line Method

GVD Implementation: Sweep Line Method

What is the invariant we are looking for?

Maintain a representation of the locus of points q that are closer to some site p_i *above* the sweep line than to the line itself (and thus to any site below the line).

 - Sweep Line Method

GVD Implementation: Sweep Line Method

Which points are closer to a site above the sweep line than to the sweep line itself?

The set of parabolic arcs form a beach-line that bounds the locus of all such points

 - Brush Fire Algorithm
 - Sweep Line Method

GVD Implementation: Beach Line Properties

- *Voronoi Edges* are traced by the break points as the *sweep line* moves down.
 - Emergence of a new *break point(s)* (from formation of a new arc or a fusion of two existing *break points*) identifies a new *edge*
- *Voronoi Vertices* are identified when two *break points* meet (fuse).
 - Decimation of an old arc identifies new vertex

HGVG as Roadmap : Basic Definitions

Single-Object Distance Function

$$d_i^x(x) = \min_{c_0 \in C_i} \|x - c_0\|$$

$$\nabla d_i^x(x) = \frac{x - c_0}{\|x - c_0\|}$$

Multi-Object Distance Function

$$D^x(x) = \min_i d_i^x(x)$$
